NB6C/NB8C Low Down Pillow-ball Upper Mount for rear

NB6C/NB8C Low down pillow-ball upper mount for rear

NB6C/NB8C Low down pillow upper mount for rear 52675-NB6-000

List price 27,000yen L&R 1set

Lowers the rear ride height by an extra 30mm compared to TODA's std rear pillow ball upper mount. (Distance between fitting points of the fightex damper and the pillow upper mount is reduced by 24.3mm.)
30mm ride height has some difference from dampers' height by lower arm lever ratio.

The NB roadsters original rear damper is short in length, lowering means reducing the length of the damper , compromising stroke.

Now this Rear Low Down Pillow Ball Upper Mount makes it possible to further lower the ride height without sacrificing the stroke of the damper.

For example

Fightex Type FS. This Damper kit can now be fitted to reduce the rear ride height by 60mm (Compared to standard ride height) but still retaining an acceptable damper stroke length. (7K-200 ID60 springs used)

Can be used with DA type dampers, too.

High quality MBWT18 pillow balls are used.

Note

Reducing the ride height of the rear suspension may require a change in length of the front damper.

Please contact us if considering purchasing a fightex damper kit with this "Low down pillow ball upper mount".
